Building Reports, Dashboards and Custom Pages (UI Builder) for the Application

Application: Bank Loan Application Form

Name: Tharika R

Roll No: 241401117

Department: Computer Science and Business Systems (CSBS)

241401117

1. Aim

To build reports, a dashboard and a custom page using the UI Builder of Zoho Creator for the existing Bank Loan Application Form (Loan_Application_Form), so that submitted loan application records can be organised, filtered and reviewed by bank loan officers, and key application information can be presented through a single, unified interface.

2. Procedure

2.1 Building the Reports

All reports in this experiment use `Loan_Application_Form` as the source form. A report displays the records stored through the form, so each submitted loan application appears as one row. The reports are described below.

Report 1: Loan_Application_Report — All Loan Applications

This is the report specified in the original assignment for listing all submitted loan applications. Its steps are as follows.

1. Open the Loan Application & Pre-Screening Management application in Zoho Creator and select **Reports** in the application structure.
2. Open `Loan_Application_Report`, which uses `Loan_Application_Form` as its source form and displays the records in a tabular (list) format.
3. Confirm that the report columns correspond to the fields captured by the form, as listed in Table 1.
4. Use the search and filter options of the report to narrow the records, for example by Loan Type or Monthly Income, wherever the report supports it.
5. Open individual records from the report to read the complete applicant details before document verification.

Report 2: Loan Type Summary

A separate report named **Loan Type Summary** is configured on `Loan_Application_Form` to group the applications by the `Loan_Type` field. Grouping places the applications under their respective loan categories, such as Home Loan, so that a loan officer can review all applications of one category together and route them to the appropriate officer.

Report 3: Loan Application Summary

A consolidated report named **Loan Application Summary** is configured to display only the key details needed for quick review: Applicant Name, Email Address, Contact Number, Loan Type, Employment Type and Monthly Income. Limiting the columns gives a compact view that is convenient for pre-screening, while the complete record remains available in `Loan_Application_Report`.

24140117

2.2 Building the Dashboard Page (UI Builder)

A page named `Loan Dashboard` is created using the Pages option of Zoho Creator and designed in the UI Builder. The dashboard is intended to summarise the loan application data of the form. The steps are as follows.

1. **Total Loan Applications:** Add a summary component that displays the total number of records submitted through `Loan_Application_Form`. The value is taken from the actual application data, so it changes as new applications are submitted.
2. **Loan Type Chart:** Add a chart based on the `Loan_Type` field to show the number or distribution of applications across the available loan categories.
3. **Employment Type Chart:** Add a chart based on the `Employment_Type` field to show the distribution of applications between Salaried and Self-Employed applicants.
4. **Report Navigation:** Add buttons or links that open `Loan_Application_Report`, Loan Type Summary and Loan Application Summary, so that the officer can move from the overview to the detailed records.
5. **Page Layout:** Arrange the components in a clear order, with the summary at the top, the charts in the middle and the report navigation below.
6. **Preview and Testing:** Preview the page and check the dashboard display, the chart data, the summary value and the report navigation.

2.3 Creating Custom Pages Using UI Builder

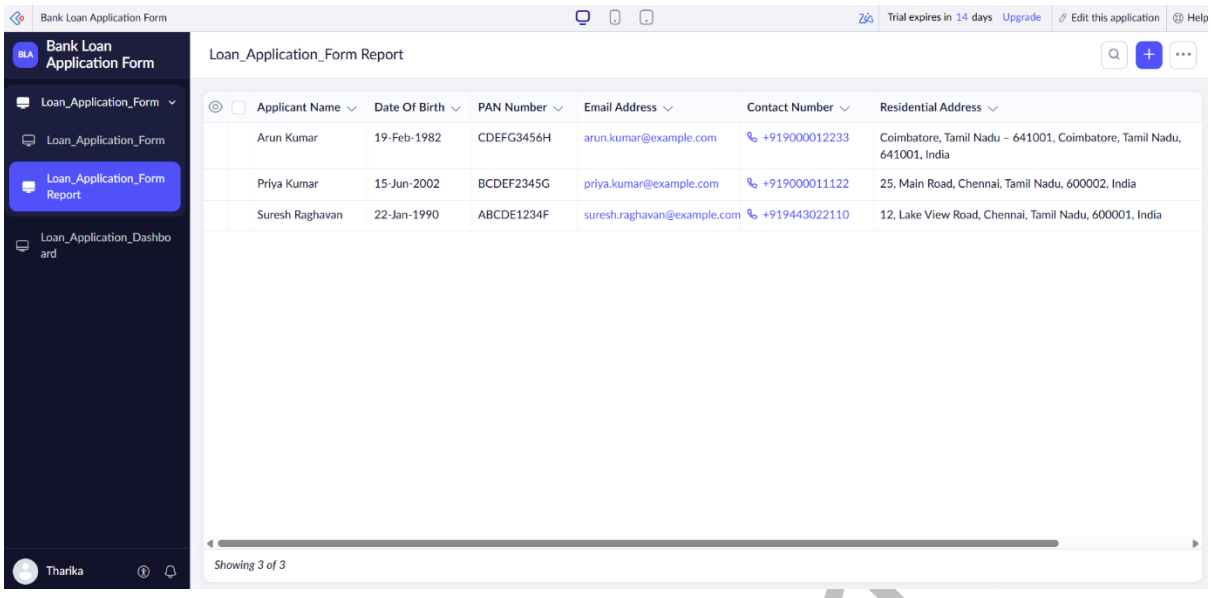

A custom page built with UI Builder acts as a single entry point for bank officers. Instead of opening each report separately, the officer can view the application summary, the charts and the links to the reports on one screen, which makes the stored application data easier to read and act upon. The page is created as follows.

1. Open Pages in the existing Zoho Creator application.
2. Create a new page, or open the existing one, using UI Builder.
3. Arrange the available summary, chart and navigation components on the page canvas in a clear and logical layout.
4. Configure the components to use the existing application data and reports of Loan_Application_Form.
5. Preview the page and verify the navigation and the displayed information.

3. Output

Loan Application Report

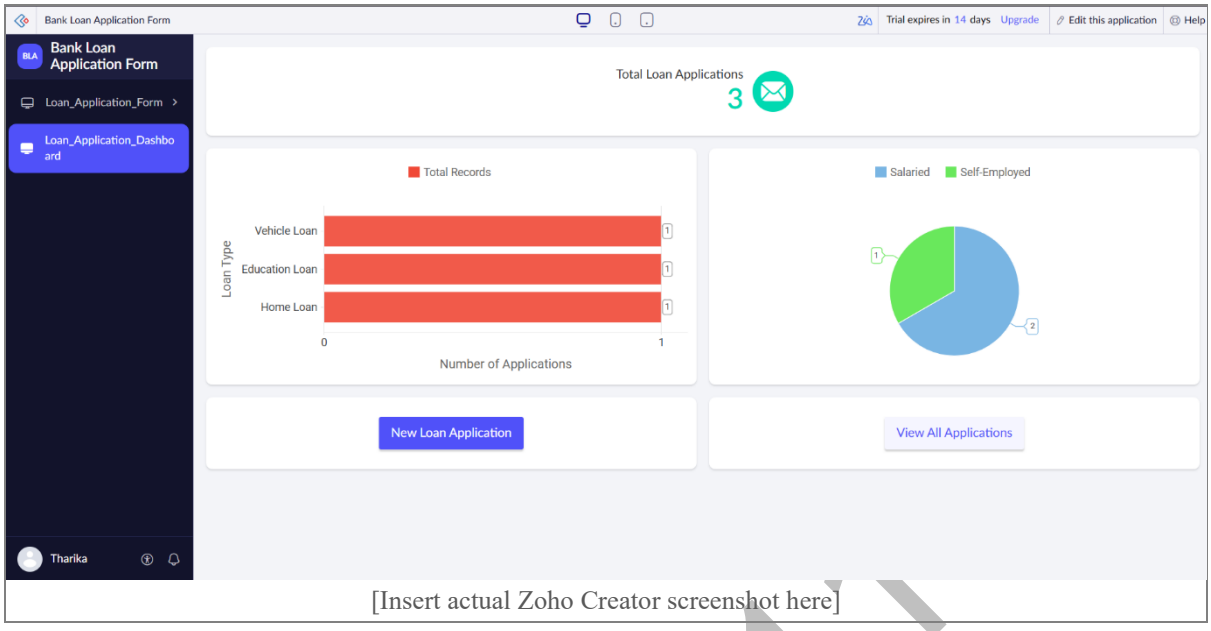

ort

Loan_Application_Report — consolidated view of submitted bank loan applications.

Loan Applications by Type — Kanban view of loan applications organized by loan type, displaying applicant names and addresses.

Loan Dashboard

[Insert actual Zoho Creator screenshot here]

Loan Dashboard — total application count and charts showing loan application distributions.

2414011

4. Result

The experiment demonstrates how Zoho Creator can be used to organize bank loan application records through reports, dashboards and custom pages built with UI Builder. The reports are intended to support convenient review of submitted applications, the grouping by loan type supports categorization of applications, and the dashboard charts present application information visually, helping bank loan officers to pre-screen and route applications more efficiently.
