PRACTICAL RECORD

EXPERIMENT 7

Integrating Zoho Creator Application with another Zoho sevice using a Connection and APIs

Application: Bank Loan Application Form

241401117

Name : THARIKA R

Register Number : 241401117

Experiment 7

1. Aim

To create a connection between Zoho Creator and Zoho Calendar, and to use that connection in a Deluge script so that a new calendar event is created automatically whenever a loan application is successfully submitted through the Bank Loan Application Form.

2. Introduction

Zoho Creator is a low-code platform for building database-driven applications. Its Microservices section lets an application communicate with external services through components such as AI Models, AR Library, Connections, Datasources and Custom APIs. A Connection stores the authorization that allows Creator to call another service securely, without placing credentials in the application code.

Deluge (Data Enriched Language for the Universal Grid Environment) is the scripting language of Zoho Creator. Workflows written in Deluge run on form events such as successful submission. In this experiment, a Zoho Calendar connection is authorized and then called from a Deluge workflow to record each loan application as a calendar event.

24140117

3. Procedure

1. Open Zoho Creator and select Microservices under the Develop menu.
2. Click Create New and choose Connections (Pick & Create) from the list of microservice components.
3. In the Add Connection screen, select Zoho Calendar from the built-in connectors.
4. Enter the connection name, set the authorization access to Administrators only, choose Quick connect (Zoho credential) as the connection mode, and click Create And Authorize.
5. On the Zoho consent page, review the Calendar permissions requested by Creator, tick the permission checkbox and click Accept.
6. Open the created connection and turn on Connection Access for the Bank Loan Application Form application.
7. Open the Workflow section of the application and create a workflow on the Loan_Application_Form that runs on successful form submission.
8. In the Deluge script editor, build the event description from the submitted form fields, then call zoho.calendar.createEvent using the calendar UID and the connection link name, and save the script.
9. Verify in the Workflow section that the workflows are listed and enabled.

4. Output and Step-by-Step Explanation

4.1 Microservices Page

The Microservices page is opened from the Develop section of the Creator left navigation menu. Since no microservice has been created yet, Creator shows the message "Start building your microservice" together with a Create New button. This button is the starting point for adding a connection.

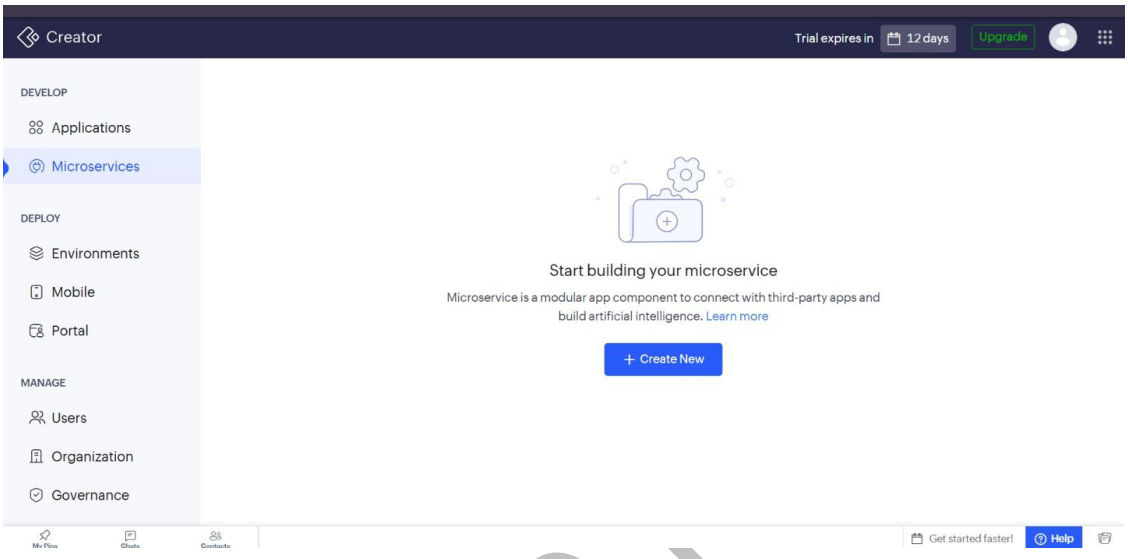

Figure 7.1: *Microservices page in Zoho Creator with the Create New option*

4.2 Selecting the Connections Option

After Create New is clicked, a list of microservice components is displayed. It contains AI Models, AR Library, Connections, Datasources and Custom API. Because the aim is to link Creator with an external Zoho service, the Pick & Create button beside Connections is selected.

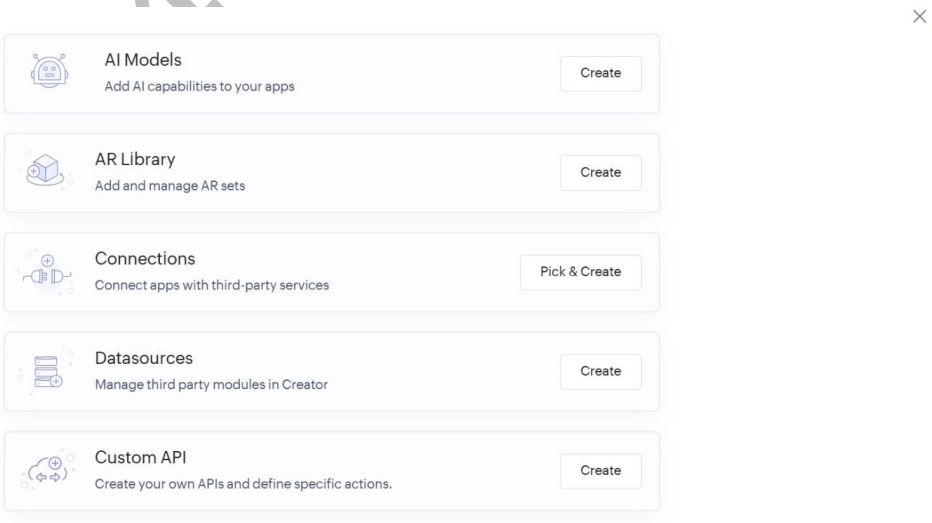

Figure 7.2: *List of microservice components with the Connections option*

4.3 Choosing the Zoho Calendar Connector

The Add Connection screen lists the built-in connectors that Creator provides, grouped by categories such as Zoho, Accounting & Invoicing, Artificial Intelligence, Calendars & Scheduling and Cloud Storage. A search box is available to find a service quickly. Zoho Calendar is picked from this list because the application must create calendar events.

4.4 Configuring the Zoho Calendar Connection

The Zoho Calendar - Add Connection dialog is displayed after the connector is selected. It states that creating the connection authorizes Zoho Creator to exchange data with Zoho Calendar. The connection is configured as follows:

- Connection Name: Zoho Calendar Connection.
- Authorization Access: Administrators only.
- Connection Mode: Quick connect (Zoho credential).

241401

Clicking Create And Authorize saves the connection and moves on to the authorization step.

4.5 Authorizing Creator to Access Zoho Calendar

Zoho then displays a consent page stating that Creator would like to access Calendar information. The listed permissions include getting event details, adding and updating events, getting and updating calendar details, retrieving events based on search criteria and getting the free/busy status of the user. The checkbox confirming that Creator may access this data from the Zoho account is ticked and Accept is clicked to grant the permissions.

4.6 Enabling Connection Access for the Application

After authorization, the connection details page opens with the status Enabled. It shows the service name (Zoho Calendar), the link name zoho_calendar_connection, the permissions granted, the authorization setting (same for all environments) and the authorization owner (Administrator). Under Connection Access, the toggle for Bank Loan Application Form is

switched On, and a message confirms that access to the connection is turned on for that application. The link name shown here is the value used later in the Deluge script.

4.7 Deluge Script for Creating the Calendar Event

The Deluge script is written in the On Successful submission event of the Loan_Application_Form (Created > Successful form submission). The visible part of the script performs the following tasks:

- Starts a description string with the text "Bank Loan Application" and appends the applicant's full name taken from the first and last name subfields of the Applicant_Name field.
- Appends the email address, contact number, loan type, monthly income and purpose of the loan, each on a new line using \n.
- Stores the finished text in the eventDetails map under the key "description" with the put() function.
- Calls zoho.calendar.createEvent() with the calendar UID (shown as the placeholder YOUR_CALENDAR_UID), the eventDetails map and the connection link name "zoho_calendar_connection", and stores the result in the variable response.
- Displays the response with the info statement so that the result of the call can be checked.

24140117

The eventDetails map is prepared in the earlier lines of the script, which are above the portion visible in the screenshot. The calendar UID placeholder must be replaced with the UID of the actual calendar before the script is used. The script is then saved with the Save button.

4.8 Workflow Listing

The Workflow tab of the Bank Loan Application Form lists the workflows attached to the Loan_Application_Form under Created > Successful form submission. Two workflows appear, Loan_Application_Notification and On Successful submission, each with one action. Both are in the Enabled state, which shows that the script runs whenever a loan application form is submitted successfully.

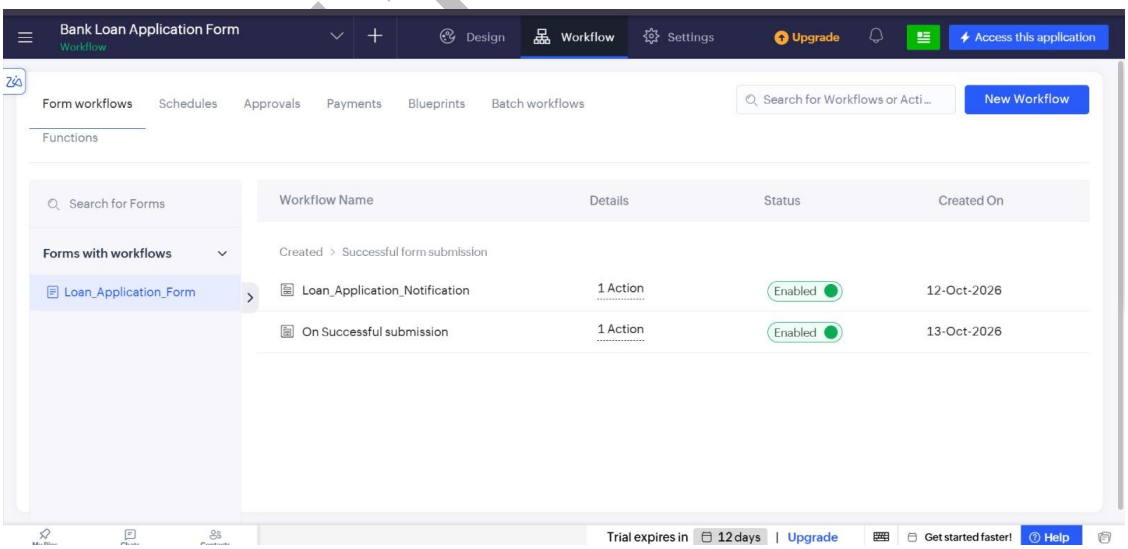

Figure 7.8: *Workflow tab showing the enabled workflows for the Loan_Application_Form*

5. Final Result

A connection named Zoho Calendar Connection (link name zoho_calendar_connection) was created in Zoho Creator and authorized with the required Calendar permissions. Connection access was enabled for the Bank Loan Application Form, and a Deluge script was added to the On Successful submission workflow of the Loan_Application_Form. The script gathers the applicant's name, email address, contact number, loan type, monthly income and loan purpose into an event description and passes it to zoho.calendar.createEvent(), so that a Zoho Calendar event is created each time an application is submitted. Both workflows were seen to be enabled, and the experiment was completed successfully.
